

### **Workholding Systems MC-P Z**

# concentric clamping, mechanically or hydraulically operated jaw widths 40, 60, 100 and 125 mm

#### **Advantages**

- Patented segment design
- Compact design
- High precision and accuracy of the manufactured workpieces by high rigidity
- High zero-point stability
- Sturdy design and good swarf protection
- Large jaw openings
- Extensive range of jaws
- Clamping of raw and finished parts without retrofitting
- Easy to maintain

#### **Application**

The workholding systems MC-PZ are especially advantageous for 5-axis machining. The compact design allows a good accessibility of the tools to the workpiece. Collision-free tool paths and a 5-sided workpiece machining can be achieved with short standard tools.

Due to the good swarf protection, workholding systems MC-P  $\rm Z$  are particularly suitable for the use in pallet systems.

The high force and stability obviate the need for pre-stamping of the workpieces.

#### **Accessories**

- Clamping jaws and jaw inserts, accessories for mounting, positioning and operation see data sheet WS 5.450Z
- Rapid change block Quintus see data sheet WS 5.6150
- Hydraulic pressure generators on request

#### **Description**

Workholding systems of the MC-P Z series excel by a very compact design and their patented segment design.

Thanks to the adjusting spindle arranged in the upper part of the housing, deformation in the base during clamping is reduced to a minimum. Thus, a high rigidity of the workholding system is obtained.

The patented segment design ensures a high degree of precision and stability. The guiding clearance is reduced to nearly zero.

All essential components are made of hardened steel.

The workholding systems MC-P 100Z/125Z are already prepared for the use on zero point clamping systems. For this purpose, there are location threads for retractable nipples at the bottom side of the housing.

For workholding systems MC-P Z, a wide range of clamping jaws is available (see data sheet WS 5.450Z).

#### Application example

Workholding system MC-P Z with workpiece-specific base jaw and form jaw used on a 5-axis machining centre.

#### Consultation

Our experts will be pleased to advise you also on site, and work with you to find the optimum clamping solution.

Extensive information such as drawings and CAD models are available on request.

#### **Customised versions**

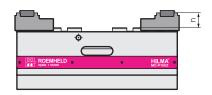

MC-P workholding systems can also be delivered as customised versions. For example with other lengths, height or with individual mounting holes.

Please contact us.

#### \*Important note

The specified clamping forces apply to a clamping height (n) of 15 mm.

For higher clamping heights, the clamping forces are reduced.

#### Technical data

Clamping principle: concentric clamping
Operation: mechanically

with a torque wrench **hydraulically** with a power unit

6-150 mm

#### MC-P 40 Z

Jaw width: 40 mm
Clamping force\*: 7.5 kN at 23 Nm
Clamping stroke: 20 mm
Max. jaw opening: 6–79 mm

#### MC-P 60 Z and ZH

Jaw width: 60 mm
Mechanical clamping force\*: 15 kN at 60 Nm
Hydraulic clamping force\*: 10 kN at 320 bar
Clamping stroke: 30 mm

#### MC-P 100 Z and ZH

Max. jaw opening:

Jaw width: 100 mm

Mechanical clamping force\*: 25 kN at 90 Nm

Hydraulic clamping force\*: 20 kN at 270 bar

Clamping stroke: 50 mm

Max. jaw opening: 6–204 mm

#### MC-P 125 Z and ZH

Jaw width: 125 mm

Mechanical clamping force\*: 40 kN at 180 Nm

Hydraulic clamping force\*: 35 kN at 270 bar

Clamping stroke: 101 mm

Max. jaw opening: 6–400 mm

#### MC-P 125 Z Compact

Jaw width: 125 mm
Clamping force\*: 40 kN at 180 Nm
Clamping stroke: 10 kN
Max. jaw opening: 6–215 mm

#### Versions

#### MC-P Z mechanically operated

In the mechanically-operated version, the clamping force is built up with a threaded spindle. When operating, both clamping slides move mechanically linked to the centre of the clamping system.

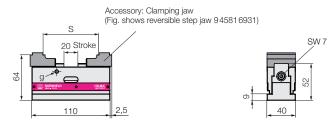

A torque wrench is used for exact and reproducible clamping force adjustment.

#### MC-P ZH hydraulically operated

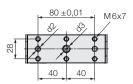

In the hydraulically-operated version, the clamping force is built up by an externally generated hydraulic pressure. When pressurising, both clamping slides move mechanically linked to the centre of the clamping system. During unclamping, the clamping slides return hydraulically to the position that had been set with adjusting screws for stroke limitation. Thus, a further unnecessary wide opening of the clamping system is avoided.

The clamping force adjustment is made by the setting of the operating pressure.
